KEY IDEA

Code should be easy to understand.

The Fundamental Theorem of Readability

KEY IDEA

Code should be written to minimize the time it would take for someone else to understand it.

It should be understandable by others, even if the code is for the developer's own good. This will also benefit the developer if reusing the code is applicable, it can be modified easily. Fewer lines of code isn't always good, it is sometimes complicated to understand. It is better to put some comments for functionality. Easy to understand code leads to well architected code. It will take efforts to consider the understanding of others and you may possibly find it unimportant in your work, but upon applying the concept of easy to understand code, it will make you become a better coder and produce something that both user and developer would love to use.
